

Group:

The goal of the technology is to enable the management of access to a broad range of services and applications, using a single technology and infrastructure. This is expected to significantly improve the delivery of these services by providing users with a common single sign-on, for both internal and external services. Service providers will be able to more easily offer their services to users from other organisations using a single common authentication mechanism. This will enhance the user's experience, and reduce costs for those organisations supporting users, and delivering services to them.

Jisc Assent, the production service underpinned by the Moonshot technology, went live on 25th March 2015. For information on, or to join the Jisc Assent service, please visit <http://www.jisc.ac.uk/assent> [2]
